14. Troubleshooting and best practices

1. Vision and purpose

Knowsoft Churchgate is a hierarchical church management and spiritual growth platform. It connects global denominations and their country, state, group, and district structures with everyday members—so leadership can steward people and data, while members grow through the Word, worship, prayer, and guided tools such as Angel.

The application is designed for high school-to-adult congregations and multi-branch networks. Data originates primarily at the district level and rolls upward so each higher unit can analyse attendance, membership, and activity without losing the pastoral closeness of the local church.

Churchgate is not a social network substitute; it is a purpose-built alternative for learning, accountability, and fellowship under church authority and General Admin oversight.

2. System architecture and church hierarchy

2.1 Hierarchical tree

Every church unit belongs to one level in a parent-child tree:

- Global — highest organisational unit (denomination or worldwide body).
- Country — national expression under a global.
- State — regional unit under a country.
- Group — cluster under a state.
- District — primary operational unit: members, weekly statistics, and most pastoral activity.

When a church registers, it selects its level and required parents. A global church needs no parent. A district must identify global, country, state, and group parents. Duplicate registration of the same institutional identity is prevented by codes and approval workflows.

2.2 Data flow

Members and weekly operational data are stored at district level. Group, state, country, and global dashboards aggregate descendant data for analysis (membership mix, attendance, and related indicators). General Admin can view global-level dashboards and deactivate a global church, which effectively suspends use of the tree beneath it.

2.3 Technology overview

The product is delivered as a web application (suitable for desktop and mobile browsers, with PWA packaging paths for store distribution). Typical stack: FastAPI backend, SQL database, server-rendered templates with progressive enhancement (Alpine.js), file storage for photos and certificates, and optional map views for global church locations.

3. Roles and access control

3.1 General Admin

- Approves or rejects global church registrations.
- Can deactivate a global church and view global dashboards.
- Manages platform-wide settings: subscription prices, platform music links, featured home programs.
- Full system backup and restore; member activity footprints.
- Confirms member subscription payments.

3.2 Church Admin (sub-admin)

- Manages one church unit and, according to level, may create child churches.
- Approves member registration requests; edits member status (worker, leader, pastor, custom titles).
- Enters weekly statistics; manages programs; church-only YouTube music; pastor messages.
- Exports member data (CSV/PDF) and may re-upload CSV updates.
- Creates focus groups; grants limited privileges (e.g. broadcast, attendance entry).

3.3 Member

- After approval (and valid subscription/trial), uses My Spiritual Space: Bible, Angel, music, devotion, directory, subscription.
- May message admin/pastor according to rules; participate in focus groups and programs.
- Cannot see full church operational dashboards unless explicitly granted pastor/dashboard privilege.

3.4 Concurrent session protection

The system can invalidate parallel logins with the same credentials so two people cannot share one account session concurrently.

4. Getting started — registration and login

4.1 Unified login

Public login is centralised. General Admin entry may use a dedicated path (for example /ks-admin/login or /admin/) depending on deployment branding, while members and church admins use the main auth pages.

4.2 Register as a church

- Choose level: Global, Country, State, Group, or District.
- Select parent churches from approved lists as required by level.
- Provide doctrine, activity days, owner/resident pastor, contact, address, country/state where applicable.
- Submit for approval. Global approvals are performed by General Admin; lower units typically wait for parent/sub-admin clearance and login details.

4.3 Register as a member

- Select the full parent path down to district.
- Provide identity details: name, sex (brother/sister), age band, confession status, contacts, optional profile picture, prayer/challenge notes.
- Account remains limited until district (or authorised) approval.
- After approval, a short welcome subscription window may apply; then paid plans require payment evidence and General Admin confirmation.

4.4 Password management

All roles can change passwords from the authenticated Password menu when that feature is enabled on the deployment.

5. Member portal — My Spiritual Space

After login, approved members land on a profile-centred spiritual workspace: themes (royal blue, pink, green, white), local clock, Angel assistant, Bible tools, dual music panels, district member directory, devotion alarms, evangelism tracker, prayer board, subscription status, church information, and links to programs and focus

groups.

5.1 Layout principles

- New life in Christ and District members share a paired row of equal card weight.
- Church music and General inspiration are separate panels for readable medium screens.
- Angel sits high under the navigation; when active it may stick while content scrolls.
- Testimonies wall may be omitted from the home portal layout; salvation certificate remains under New life in Christ.

5.2 District members directory

- Dropdown lists approved members in the same district.
- Selection shows name, district, sex, unit/role (member, worker, leader, choir, etc.), and profile picture.
- Travel flag: members can mark themselves in-district or travelled out; others see that status.

6. Angel — voice and spiritual assistant

6.1 Turning Angel on and off

- Tap the Angel button (header and/or panel). Angel speaks briefly, then remains silent and attentive.
- While on: continuous listening (browser permitting), wave animation, and status such as waves active / waiting.
- Say “Angel stop” or use Turn off to shut Angel down completely.

6.2 Animation while active

- Moving water-wave layers in blue, gold, and purple.
- Sliding light shine across the panel.
- Floating golden orb.
- Soft panel pulse and glow.
- Status line indicates listening or waiting.

6.3 Bible-centred answers

Angel answers topics using Scripture references and cross-references as the guide—for example Jesus, God, creation, faith, holiness, rapture, end time, Holy Spirit, salvation, prayer, and peace. Users may also request a specific reference (e.g. John 3:16). Saying “explain” elaborates the current portion.

6.4 Salvation guidance

Angel can lead a clear salvation path: believe, confess and forsake sin, ask forgiveness, and repeat a model prayer. The member may then use I accepted Jesus to download a New Born in Christ certificate (name, date, congratulatory text, Knowsoft branding).

6.5 Life and app commands

- Play music, change track, stop music.
- Subscription / account status advice.
- Quiet time, morning and evening devotion times.
- Special programs, pastor messages and contact pointers, focus groups, church activity days.

Angel voice works best in Chrome or Edge with microphone permission granted.

7. Bible, devotion, music, and directory

7.1 Holy Bible tools

- Book list and chapter lookup via public Bible API where configured.
- Situational reading lists (e.g. anxiety, sickness, peace).
- Slide-through verses; optional spoken reading; continuous chapter reading with progress.
- Words of Jesus emphasised where the UI supports red-letter styling.
- Volume control for speech; music may continue simultaneously.

7.2 Devotions

Members set quiet time, morning devotion, and evening devotion clocks and optional alarms/notifications.

7.3 Music

- Church music: links scoped to the member's church tree (admin-uploaded).
- General inspiration: platform defaults plus General Admin curated links.
- Default worship tracks are seeded so the lists are never empty on a healthy deploy.

8. Subscriptions and sample access

- Welcome trial after approval (configured duration, e.g. minutes-level trial in some deployments).
- Paid monthly, annual, or custom durations; General Admin sets price and confirms payment.
- On expiry: status moves to waiting approval; resources lock; member may still open Subscription to submit evidence—without forced logout.
- Sample member accounts are time-bound, cannot subscribe as full paid users, and are steered to register as real members when the trial ends.

9. Church administrator guide

9.1 Dashboard

Royal-style analytics for the unit: membership counts and mixes, charts where enabled, attendance summaries, and downloadable PDF statistical reports.

9.2 People

- Approvals queue for new members and privilege changes.
- Member list with status edits (worker types, leaders, pastors, custom titles).
- Optional broadcast privilege for trusted members.

9.3 Church music and pastor messages

- Add YouTube links retained at this church level only; descendants may inherit visibility up the chain as designed.
- Pastor messages can include optional video links for the member portal.

9.4 Programs

- Create special programs; upload either a photo or a short video (exclusive media).
- Global units may request home-page feature; General Admin approves duration and display.

9.5 Export

Download church member database as CSV (Excel-friendly) or PDF; upload CSV to update or add rows.

10. General Admin guide

- Global church approval, deactivation, and cross-church visibility.
- Subscription plan pricing and payment confirmations.
- Platform music catalogue editing.
- Home carousel: approve global programs for timed slideshow display.
- Footprints: login and activity audit (name, email, action, IP, location hint when provided by infrastructure).
- Full JSON backup and restore of operational tables.
- Payment instructions page content for churches where configured.

11. Programs, community, and communications

- Focus groups: admin creates topic and membership; members chat, like, and comment.
- Heart to Heart: benevolence-style requests and affirmations where enabled.
- Messaging: member ↔ district admin/pastor; broadcast only with privilege.
- Programs: likes/comments on media; owner-only comment edit/delete rules.

12. Backup, export, and footprints

General Admin should download backups before major upgrades or migrations. Church admins should periodically export CSV/PDF for offline records. Footprints support accountability and security review; access is restricted to General Admin.

13. Sample accounts and deployment notes

A typical seeded environment includes a General Admin (commonly admin@knowsoft.com with a published temporary password on first seed), a sample global church admin, district data, and a short-lived sample member. Passwords must be rotated in production.

Deploy on a host such as Render with environment variables for database URL and secret keys. After each release, clear build cache when static assets or seeds change, then hard-refresh browsers.

- PWA icons and manifest support installation packaging via tools such as PWABuilder.
- Default global denomination directory entries may be seeded for selection convenience.

14. Troubleshooting and best practices

- Angel silent: allow microphone; use Chrome/Edge; click Angel on again.
- Empty music: confirm seed ran; open Church music as admin and add links; platform defaults should still appear.
- Locked member portal: check subscription or pending approval; use Subscription page to submit payment proof.
- Sticky Angel covering content: turn Angel off when reading long panels, or scroll with Angel off so the panel is not sticky.
- Internal Server Error on deploy: check application logs for Python syntax or migration errors; ensure requirements install on the build image.

Operational best practice: approve members deliberately, keep district statistics weekly, export data monthly, and keep a General Admin backup before structural changes.
